Biggest Adopters of Analysis of Patterns in Time—thus far

- Google Analytics
- Major League Baseball (and other professional sports)
- Emerging methods in:
  - *Data Science*
  - *Machine Learning*
  - *Artificial Intelligence*

THE LATEST BIG FINDINGS

Using Analysis of Patterns in Time (APT)

Go to https://mapsat.iu.edu for a recording of the full presentation

Based on *temporal maps* of *learning journeys* through the online Indiana University Plagiarism Tutorials and Tests (IPTAT):

- Students who try *any* part of IPTAT designed with First Principles of Instruction (FPI; Merrill, 2020) are 2 times more likely to achieve the learning goal than not.
- Students who try *all* parts of IPTAT designed with FPI are 4 times more likely to achieve the learning goal than not.
- Students who try *no* parts designed with FPI are 1.2 times more likely ***to fail to achieve*** the learning goal (using other parts not designed with FPI).
- These conclusions are based on *Analysis of Patterns in Time* of more than 131,000 learning journeys by adult students from 169 countries worldwide between Aug. 21 and Oct. 18, 2022.

Go to https://mapsat.iu.edu for a recording of the full presentation

Enough for now? Learn more about *Analysis of Patterns in Time* at your own pace

- On the Web you can go to mapsat.iu.edu for access to
  - *Presentation slides for professional conferences*
  - *Screencasts of those slide presentations (with voice over)*
  - *Published journal articles, book chapters, and new book*
  - *Demonstration videos of how to do APT with Google Analytics*

A QUICK FLYOVER: 50 YEARS OF MY RESEARCH IN 15 MINUTES

Today’s presentation is analogous to a jet flyover from New York to San Francisco.
More details are in the underlined Web links.

Go to https://mapsat.iu.edu for a recording of the full presentation

Searching for an alternative research methodology

- In 1972 I began my learning analytics quest (50 years ago):
  - ***How can we make learning better?***
    - What research methods are needed to verify this empirically?
    - How can we verify dynamically what teachers and students do that leads to student learning achievement?
- Empirical studies using quantitative linear models (multiple regression analysis, ANOVA, ANCOVA) lacked specificity because of the state-trait approach to measurement and algebraic linear assumptions
- Empirical studies using qualitative methods (ethnography, episodic narrative) lacked generalizability because of small sample sizes and selection bias

Go to https://mapsat.iu.edu for a recording of the full presentation

1976: I invented *Nonmetric Temporal Path Analysis (NTPA) as an alternative*

- The fundamental idea of a ***temporal map*** emerged
- We needed something analogous to orchestral scores and EKG's
  - *Parallel timelines*
  - *Ways to characterize change*

Temporal Map Example:

3	0.27	0.56	0.26	0.01	0.30	0.43	0.97	0.41
4	0.34	0.69	0.34	0.00	0.35	0.31	1.00	0.53
5	0.48	0.73	0.47	0.01	0.25	0.26	0.98	0.49
6	0.40	0.75	0.39				0.98	0.59
7 - 25	…	…	…				…	…
Mean (SD)	0.432 (0.144)	0.741 (0.101)	0.416 (0.139)	0.015 (0.010)	0.324 (0.114)	0.243 (0.104)	0.967 (0.029)	0.573 (0.142)

The likelihood of Student Engagement was 0.967 *when Direct Instruction was occurring.*

Key: DI = Direct Instruction; EN = Student Engagement;
NE = Student Non-Engagement; ND = Non-Direct Instruction

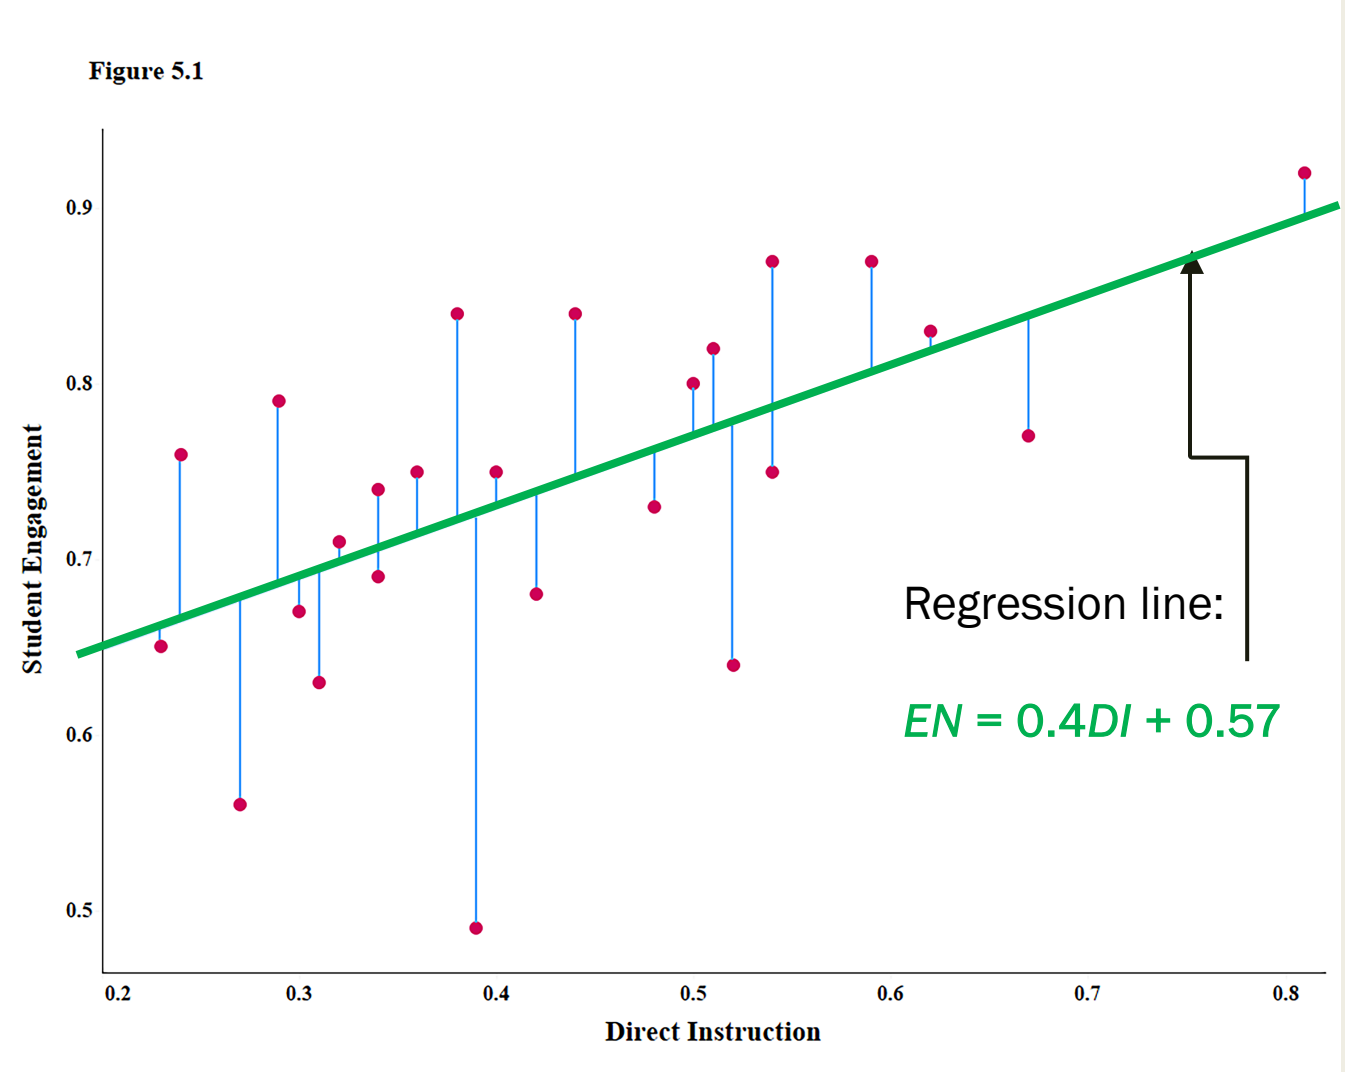
1983: Linear models scatterplot [Frick]

Pearson correlation

$r = 0.57$
$r^2 = 0.33$

NTPA probabilities

$p(EN|DI) = 0.97$
$p(EN|ND) = 0.57$
$p(NE|DI) = 0.03$
$p(NE|ND) = 0.43$



Key: DI = Direct Instruction; EN = Student Engagement;
NE = Student Non-Engagement; ND = Non-Direct Instruction

1983: Conclusion from *same classroom observations*

- **NTPA approach**
  - *When direct instruction is occurring, mildly handicapped students in elementary schools are engaged about 97 % of the time.*
  - *When direct instruction is not occurring, those students are engaged about 57 percent of the time. Students are about 13 times more likely NOT to be engaged in academic tasks when NO direct instruction is occurring.*
- **Linear models approach**
  - *The amount of time spent in direct instruction is correlated moderately and positively with the amount of student engagement time ($r = 0.57$)*
  - *33 % of the variance in student engagement time is predicted by the amount of direct instruction time; 67 % of the variance in student engagement time is NOT predicted by the amount of direct instruction ($r^2 = 0.57^2 = 0.33$; $1 - 0.33 = 0.67$)*

1983: Why the difference in conclusions from *same classroom observations?*

- NTPA approach *measures the relations*

  whereas

- Linear models approach *relates the measures*

- This is not a play on words, but a profound difference in approach to characterizing relations.

1990:

NTPA name changed to:

Analysis of Patterns in Time
(APT)

Method remained the same--only the name changed

American Educational Research Journal
Spring 1990, Vol. 27, No. 1, pp. 180–204

Analysis of Patterns in Time: A Method of Recording and Quantifying Temporal Relations in Education

Theodore W. Frick
Indiana University

Analysis of patterns in time (APT) is a method for gathering information about observable phenomena such that probabilities of temporal patterns of events can be estimated empirically. If appropriate sampling strategies are employed, temporal patterns can be predicted from APT results. As an example of the fruitfulness of APT, it was discovered in a classroom observational study that elementary students were on task 97% of the time if some form of direct instruction was occurring also, whereas they were on task only 57% of the time during nondirect instruction. As a second example, APT results were used as a rule base for an expert system in adaptive computer-based testing. When two different computer tests were studied, average samples of 9 and 13 test items were required to make mastery and nonmastery decisions when items were selected at random. These decisions were, respectively, 94% and 98% accurate compared to those reached from two much larger test item pools. Finally, APT is compared to the linear models approach and event history analysis. The major difference is that in APT there is no mathematical model assumed to characterize relations among variables. In APT the model is the temporal pattern being investigated.

What is Analysis of Patterns in Time (APT)?

- APT is a research methodology invented by Frick in 1970s
- APT is an alternative to the linear models approach (LMA—e.g., multiple regression, ANOVA): In the 1970s
  - *LMA was the prevalent quantitative approach to educational research*
  - *Qualitative methods were rarely used in educational research*
- APT draws from general systems theory, information theory, set theory, probability theory, and Bayesian reasoning
- ***Temporal maps*** are created as the main source of data for APT
- APT queries are then used to segment temporal maps for matching conditions, and for counting occurrences of temporal patterns
- APT queries result in probabilistic measures of temporal patterns (likelihoods, odds, cumulative time)

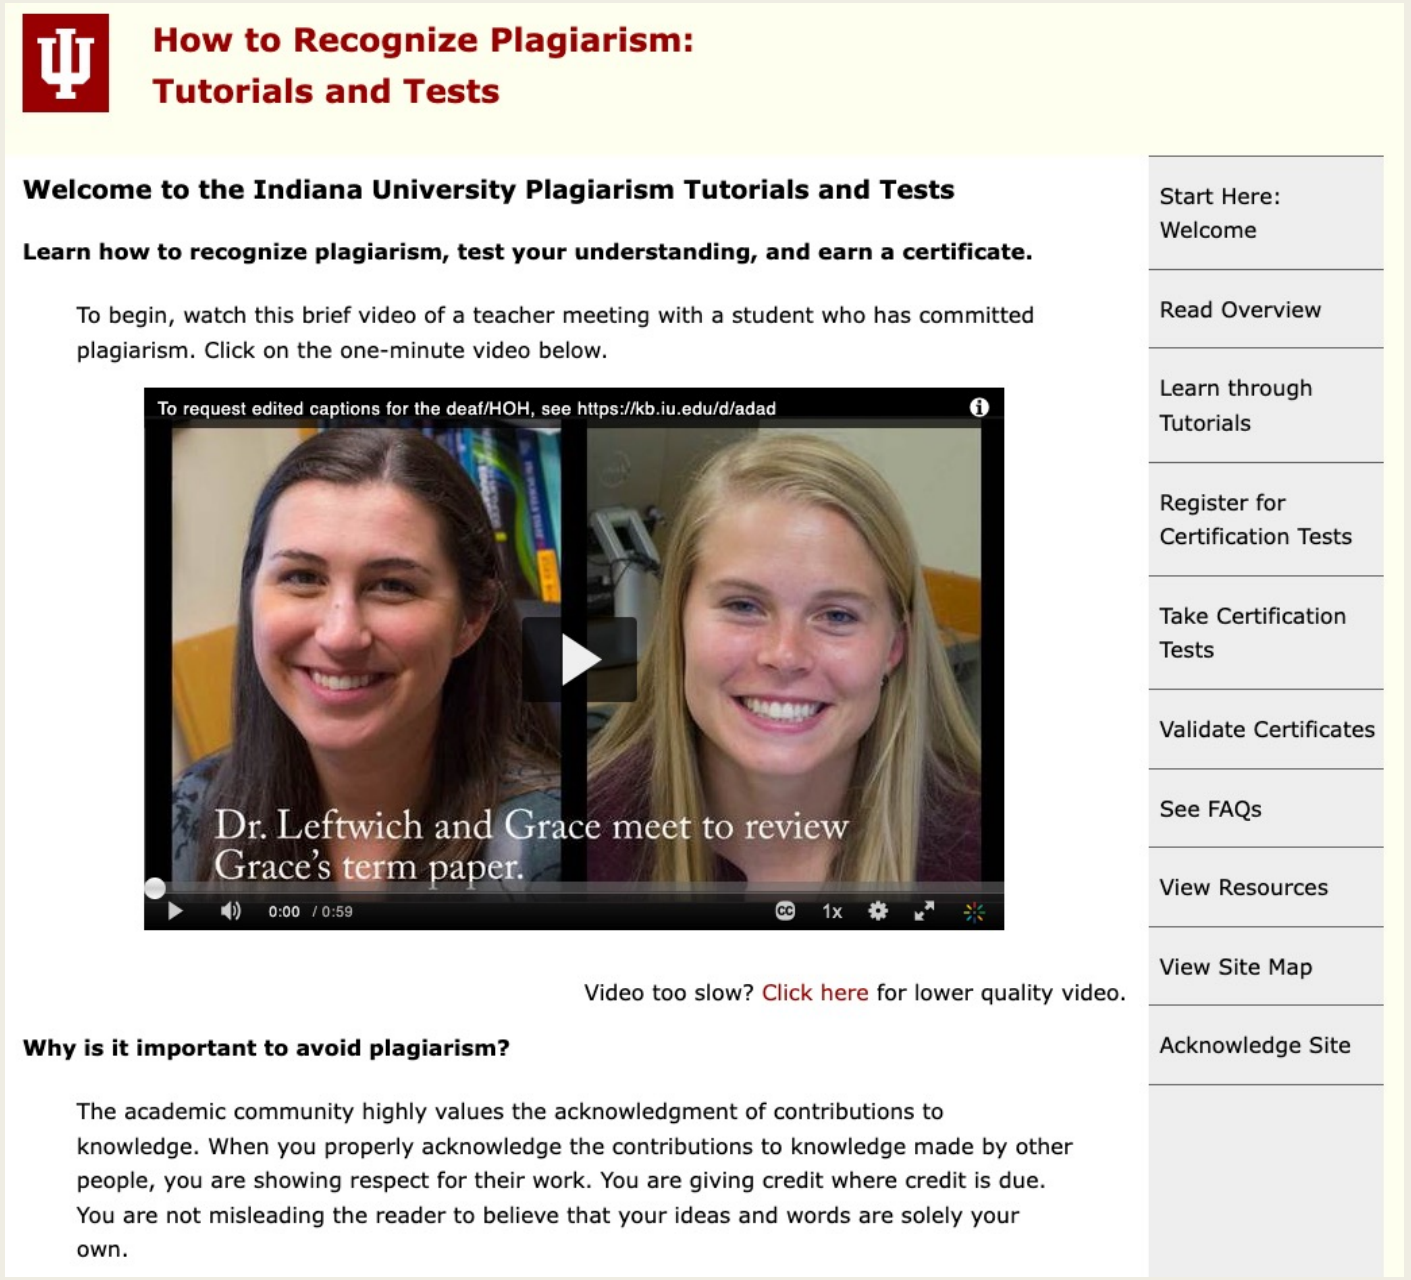
2016:

Redesign of Indiana University Plagiarism Tutorials and Tests (IPTAT) using First Principles of Instruction

[Initial design was in 2002]



Go to https://mapsat.iu.edu for a recording of the full presentation

First Principles of Instruction (FPI) used to redesign IPTAT: [Source: Merrill, 2020]

1. ***Authentic problems or tasks*** for students to do, arranged from simple to complex (e.g., https://plagiarism.iu.edu/tutorials/index.html);
2. ***Activation*** of student learning by helping students connect new learning with what they already know or believe (e.g., https://plagiarism.iu.edu/tutorials/task1/activation.html);
3. ***Demonstration*** of what is to be learned, by showing a variety of examples (e.g., https://plagiarism.iu.edu/tutorials/task1/demonstration.html);
4. ***Application*** of what is being learned, so students can try themselves and feedback is provided (e.g., https://plagiarism.iu.edu/practiceTest.php?task=1&item=1); and
5. ***Integration*** of what has been learned into students' own lives (e.g., https://plagiarism.iu.edu/tutorials/task1/integration.html).

Go to https://mapsat.iu.edu for a recording of the full presentation

From 2016 through 2020, Google Analytics was creating millions of APT temporal maps on IPTAT usage, but we did not know we could do APT queries with Google Analytics.

New book: 2022

- Google Analytics tracked student use of IPTAT website for 2 years, 2019-20
  - *Approximately 936,000 learning journeys, students from 222 countries and territories worldwide*
  - *About 1.9M temporal maps, 36M pageviews*
- We discovered in 2020 that Google's Universal Analytics (UA) could be leveraged to do Analysis of Patterns in Time (APT) when coupled with Excel spreadsheets
- Main APT finding: Successful students viewed 3 to 4 times as many unique Web pages designed with First Principles of Instruction as did unsuccessful students

SUMMARY

After 50 years of research with Analysis of Patterns in Time

Go to https://mapsat.iu.edu for a recording of the full presentation

Summary: Analysis of Patterns in Time

- APT is a fruitful methodology for investigating the instrumental value of instruction to promote student learning achievement.
- GA4 when supplemented with Excel can do some kinds of APT as envisioned originally by Frick (1983, 1990) and Myers and Frick (2015).
- GA4 is somewhat easier to use for doing APT when compared with Google's earlier Universal Analytics. In both cases, Excel is needed for further computations of likelihoods and Bayesian analysis.
- For more on APT and designing online instruction with First Principles of Instruction, see our new book: *Innovative Learning Analytics for Evaluating Instruction: A Big Data Roadmap for Effective Online Learning* (2022, Routledge Focus Series)
